

THE WHITE HOUSE

A CLEANER, MORE EFFICIENT POWER SECTOR IN CALIFORNIA

We have a moral obligation to leave our children a planet that's not polluted or damaged, and by taking an all-of-the-above approach to develop homegrown energy and steady, responsible steps to cut carbon pollution, we can protect our kids' health and begin to slow the effects of climate change so we leave a cleaner, more stable environment for future generations.

We already set limits for arsenic, mercury and lead, but we let power plants release as much carbon pollution as they want. Yet, the effects of climate change are already being felt across the nation. In the past three decades, the percentage of Americans with asthma has more than doubled, and climate change is putting those Americans at greater risk of landing in the hospital. Droughts are becoming more frequent and more severe in the West. And extreme weather, from hurricanes to heat waves, are hitting communities across the country. Now is the time to act. We have already made progress by moving to cleaner sources of energy and improving the energy efficiency of our cars, trucks and buildings. Now, EPA is setting carbon standards for power plants to protect public health and welfare.

Improving the Health of California Residents

We know climate change will put vulnerable populations at greater risk – including the elderly, our kids, and people already suffering from burdensome allergies, asthma, and other illnesses. According to the most recent estimates from the Centers for Disease Control and Prevention, 8.8 percent of California's adult population suffer from asthma. The sooner we act, including by taking responsible steps to cut carbon pollution from existing power plants, the more we can do to prevent impacts to this already-vulnerable group.

In 2012, 48 million metric tons of carbon pollution were emitted from power plants in California – equal to the yearly pollution from over 10 million cars. In addition to reducing a portion of this carbon pollution, EPA's guidelines will also cut other forms of air pollution like soot and smog. In the first year of the program alone, these reductions will provide important health protections nationally, including preventing 100,000 asthma attacks in children and young adults and avoiding 1,800 – 4,270 premature deaths and up to 2,100 heart attacks. California residents will benefit from a share of these national health protections.

State Flexibility in Achieving Carbon Pollution Targets

States will have flexibility to meet EPA's target using the energy sources that work best for them and by cutting energy waste. To date, more than 35 states already have renewable energy targets, over 25 states have state-wide programs to cut energy waste, and 10 have adopted market-based greenhouse gas emissions programs. EPA's proposal builds on progress already underway in each state and provides guidelines for states to develop plans to meet their carbon pollution reduction targets. It allows states to work alone to develop plans or to work together with neighboring states to develop multi-state plans, creating thousands of good jobs for Americans who are making our electricity system cleaner and our homes and businesses more energy efficient.

Cutting Carbon Pollution in California

Through the President's leadership, and the initiative of the state of California, local communities, and the private sector, a number of common-sense measures to combat carbon pollution in California are already in place. In fact, between 2008 and 2011, carbon emissions from the power

sector decreased by almost 30 percent in California. EPA's flexible proposed guidelines for power plants will continue driving cost-effective measures to reduce carbon pollution in California, building off of recent progress:

- ***Increased Deployment of Clean Energy:*** Since the President took office, we have increased U.S. solar-electricity generation by more than ten-fold and tripled U.S. electricity production from wind power. In California, renewable energy generation from these sources increased by more than 40 percent. Since 2009, the Administration has supported tens of thousands of renewable energy projects throughout the country, including 42,800 in California, generating enough energy to power more than 900,000 homes. California already has a goal to generate 33 percent of its electricity from renewable energy resources by 2020.

In addition, the Administration has supported construction of the first nuclear reactors in three decades as well as research and development for new small modular nuclear reactors; made an historic investment of more than \$6 billion in clean coal technologies; and worked to streamline permitting of new hydropower as well as the transmission lines that connect clean power to consumers.

- ***Market-Based Emission Reduction Program:*** California recently launched its cap-and-trade program, which uses a market-based approach to lower greenhouse gas emissions. California's emissions trading system will reduce greenhouse gas emissions from capped sources by 15 percent between 2013 and 2020. It is a central component of the state's broader strategy to reduce total greenhouse gas emissions to 1990 levels by 2020.
- ***Improved Energy Efficiency:*** Using less energy to power our homes and businesses is critical to building a clean and secure energy future. President Obama has made essential investments in research and development to advance energy efficiency, and set new standards to make the things we use every day more efficient. Since October 2009, the Department of Energy and the Department of Housing and Urban Development have jointly completed energy upgrades for nearly two million homes across the country, saving many families more than \$400 on their heating and cooling bills in the first year alone, bringing the state of California closer to reaching its goal of cutting energy consumption 10 percent within 10 years. Already, local communities and the private sector are taking initiative:
 - As part of the President's Better Buildings Challenge, the cities of Los Angeles, Sacramento and San Buenaventura committed to reducing energy intensity in their city-owned buildings 20 percent by 2020, covering 30 million square feet in L.A., 12 million square feet in Sacramento, and 560 thousand square feet in San Buenaventura. Placer County committed 5 million square feet of city buildings to the same goal.
 - Multifamily Residential Partners, Satellite Affordable Housing Associates, and Tenderloin Neighborhood Development Corporation committed to reducing energy intensity 20 percent in 10 years in a combined 4 million square feet of buildings throughout California.
 - University of California-Irvine reduced its energy intensity 8.8 percent by 2012 in 7 million square feet of building space.
 - The City of San Diego committed to reducing energy intensity 20 percent in 9.5 million square feet by 2020.

- ***Increased Utilization of Natural Gas:*** The U.S. produces more natural gas than ever before – and nearly everyone’s energy bill is lower because of it. “In fact, in 2012, total electricity generation from natural gas power plants increased by more than 50% compared to 2008.”
