Cost Accounting Standards Board 725 17th Street, NW Room 9013 Washington, DC 20503 ATTN: Laura Auletta

Re: CAS-2007-02S

Dear Ms. Auletta:

This letter is a response to the Staff Discussion Paper (SDP) regarding the Harmonization of Cost Accounting Standards 412 and 413 with the Pension Protection Act of 2006 (PPA).

We are writing on behalf of The Segal Company, a national actuarial and employee benefits consulting firm, and, its Sibson Consulting division. Segal has had extensive experience with determining pension costs under the Cost Accounting Standards (CAS) on behalf of its government contractor clients. Briefly stated, we believe that Standards 412 and 413 should incorporate the key principles of the PPA.

The PPA Changes

The PPA completely rewrote the funding rules for single-employer defined benefit pension plans. The changes include:

- > Creation of a New "Funding Target" that Requires 100 Percent Funding over Seven Years
 Instead of "actuarial accrued liability, the new rules focus on a "funding target." The PPA
 requires single employer plans to amortize their funding target— whether due to plan
 amendments, assumption changes or experience losses— over seven years.
- > Single Funding Method For minimum funding purposes, employers will no longer be able to choose a funding method to match to their preferred cash-flow budgets. The funding target will be based on benefits accrued as of the beginning of the plan year; and all benefit growth during the year, including increases in previously earned benefits due to pay raises, will be included in each year's "target normal cost."

Benefits, Compensation and HR Consulting ATLANTA BOSTON CALGARY CHICAGO CLEVELAND DENVER HARTFORD HOUSTON LOS ANGELES MINNEAPOLIS NEW ORLEANS NEW YORK PHILADELPHIA PHOENIX PRINCETON RALEIGH SAN FRANCISCO TORONTO WASHINGTON, DC

CAS-2007-02S August 30, 2007 Page 2

- > Prescribed Actuarial Assumptions The PPA requires all plans to use an interest rate based on a Treasury-devised index of rates on investment-grade corporate bonds. These rates will be reflected in a simplified yield curve that will take into account each plan's demographics. The PPA also mandates use of a specific mortality table, with some exceptions.
- > Limited "Smoothing" of Measurements Asset values can be smoothed over no more than 24 months and will have to be within 90 to 110 percent of market value. Interest rates will also have to be averaged over 24 months (down from the four-year average used for the Deficit Reduction Contribution and the long-term assumptions otherwise used).

Thus, the PPA changed the minimum funding requirements to utilize a mark-to-market approach that looks to the current financial markets to determine the value of the assets and liabilities of the pension plan.

CAS Harmonization: Updating CAS 412 and 413

The PPA requires the Cost Accounting Standards Board to revise CAS 412 and 413 to "harmonize" government reimbursable pension plan costs with the minimum required contribution.

In addition, CAS costs should follow the minimum required contribution rules in order to maintain fairness and equity. The original Standards 412 and 413 were modeled after the minimum funding requirements of ERISA. However, over the ensuing years, minimum funding and CAS rules have diverged. In many cases, an additional deficit reduction contribution was required, but there was no corresponding CAS allowable cost. In many cases, government contractors have had to make contributions that have not been reimbursable over many years and have built up large prepayment credits that may not usable for many years in the future. Without harmonization, the PPA changes would exacerbate the problem of CAS costs not matching the contribution requirements.

While some disagree with the mark-to-market philosophy, this approach has been required by the accounting profession for quite a while. Under rules issued by the Financial Accounting Standards Board and the International Accounting Standards Board, discount rates must reflect the current financial markets and smoothing of costs is limited. Now, that the PPA has adopted this approach for funding, CAS 412 and 413 should follow this approach.

Thus, Standards 412 and 413 should incorporate the key principles of the PPA.

CAS Harmonization: Mitigating Volatility

The SDP requested comments on mitigating volatility because several provisions of the PPA, such as utilizing a market-based yield curve, may make it harder to predict and manage costs. While this is of real concern — for all pension sponsors and not just for the federal government, which assumes risk under cost-plus contracts, and for government contractors, which assume risk

CAS-2007-02S August 30, 2007 Page 3

under fixed-price contracts. Still, the PPA clearly requires that CAS costs be harmonized with the minimum required contribution. The effect of volatility can be minimized by amortizing extraordinary gains or losses.

We are aware that several groups have already submitted comments with additional details. So as not to be repetitive in our comments, we point out that Segal is a member of the National Defense Industrial Association, and we concur in broad measure with its comments, as well as with those submitted by Messrs. Curtis, Friedman, Ma, McQuade, Rich and Tully, both of which are attached.

We appreciate the opportunity to comment and look forward to participating in future discussions.

Sincerely,

Thomas D. Levy, FSA, MAAA, FCA, EA, FCIA Senior Vice President, Chief Actuary

The Segal Company

Cost Accounting Standards Board Attention: Laura Auletta 725 17th Street, NW Room 9013 Washington, DC 20503

Reference case CAS-2007-02S

We want to thank the Cost Accounting Standards Board for recognizing the value of industry comments at this point in the harmonization process for CAS 412 and 413. In support of your request, we are submitting this response letter.

Industry believes that for the CASB to achieve harmonization as mandated by Congress, the revisions to CAS must generally rely on the calculations of the minimum required contribution of PPA. We recognize the discomfort of accepting this, as the PPA calculations create an exposure to volatility. However, we believe the CASB has options available to mitigate these volatilities in ways that fairly and equitably balance the needs of both Government and contractors while satisfying the mandate for harmonization. We also believe that it is imperative the CASB consider temporary transitional rules to smooth any abrupt change in costs as a result of implementation of revised CAS. We recommend that these transitional rules be eliminated as of an established date when pension costs would be expected to stabilize under the new CAS provisions.

As members of industry, we are aware that the circumstances of each Government contactor with a defined benefit pension plan bring a unique perspective and set of concerns to this harmonization effort. Those circumstances include current pension plan funding levels, existing cumulative assignable cost deficits or prepayment credits, shifting contract mixes, implementation or deferral of the PPA funding requirements, and the like. However, we all share some of the same concerns. How much cash will be needed for our minimum required contribution under PPA—immediately and ongoing? What impact will this cash outlay have on the financial capabilities of our business, including our ability to maintain operational cash flow to perform on Government contracts? What other plans may we have to sacrifice to get the cash needed immediately? How will the harmonization of CAS impact costs reimbursed through contracts and when? We understand that the Government has analogous concerns to ours. How much cash will be needed to pay contractors—immediately and ongoing? What impact will this cash outlay have on other planned expenditures? How will the harmonization of CAS impact costs paid through contracts and when? It is important that the CASB understand and consider the concerns of all interested parties in the process of harmonizing CAS.

As with most complex and difficult regulatory challenges, we do not expect harmonization to cure every conceivable ill, nor address every contractor's unique circumstances or the Government's with perfection. However, across industry there is the expectation that the CASB will execute this assignment in accordance with its objectives, as published in the Federal Register (July 13, 1992), which includes the design of fair and equitable standards that show neither bias nor prejudice to either the contractor or the Government. We encourage the Board to continue to ask questions to obtain information and data, develop an understanding of the multifaceted issues from all perspectives, and consider alternatives available. In support of these significant efforts of the Board, industry will continue to provide appropriate information and data as requested.

Question 1. Should the Board apply any revisions to all cost-based contracts and other Federal awards that are subject to full CAS coverage, or only to "eligible contractors" as defined in Section 106?

Any revisions to CAS 412 and 413 should apply to all contractors. CAS 9901-302(b) states that the cost accounting standards are "designed to achieve uniformity and consistency in cost accounting practices governing measurement, assignment, and allocation of costs to contracts with the United States Government." Promulgation of a revised standard applicable to only a portion of the contractors covered by CAS would be contradictory to achieving uniformity and consistency. There would be differences between contractors based on their individual status of eligibility affecting consistency. There could also be differences for a single contractor's eligibility across cost accounting periods due to changes in the balance of Government and commercial work performed, as programs turnover and acquisitions or divestures are made by the company, which would affect uniformity.

Question 2. Does the current CAS 412 and 413 substantially meet the Congressional intent of the PPA to protect retirement security, to strengthen funding and ensure PBGC solvency?

We believe the current CAS 412 and 413 do not meet the Congressional intent of the PPA. More importantly, Congress would not have required the CASB to revise these standards if Congress believed them to already meet their intent with PPA.

The Board may be considering whether the "harmonization" of CAS with PPA means the standards should be designed "to protect retirement security, to strengthen funding and ensure PBGC solvency", and furthermore, the Board may be considering if the existing CAS 412 and 413 are already so designed. We

disagree with this interpretation of the harmonization requirement, and even if such an interpretation were assumed, we disagree that the standards are already so designed.

The interpretation of "harmonization" implied by this question is one of alignment with the intentions of PPA rather than with the calculations of PPA. This interpretation is inconsistent with the language in Section 106 of the PPA which requires revision of CAS "to harmonize the minimum required contribution under the Employee Retirement Income Security Act of 1974 [ERISA] of eligible contractor plans and government reimbursable pension costs…" It is clear to us that Congress intends this harmonization to generally be of the mathematical calculations of the ERISA minimum funding and the CAS pension costs. Of course, to harmonize the calculations may likely achieve alignment of the intentions described as well.

Question 3. Should CAS harmonization be focused only on the relationship of the PPA minimum required contribution and the contract cost determined in accordance with CAS 412 and 413?

We believe the Board should focus only on the relationship of the PPA minimum required contribution and the contract costs in accordance with CAS 412 and 413 during their harmonization effort. Section 106 of the PPA states very clearly that the Board is to revise CAS 412 and 413 "to harmonize the minimum required contribution under the Employee Retirement Income Security Act of 1974 and the government reimbursable pension plan costs..." There is no mandate for harmonization beyond the minimum required contribution or with any other amount.

Question 3(a). Do the measurement and assignment provisions of the current CAS 412 and 413 result in a contractor incurring a penalty under ERISA in order to receive full reimbursement of CAS computed pension costs under Government contracts?

The penalty for contractors due to the differences between ERISA and current CAS is the result of increased contributions required by the PPA and the inability under current CAS to receive timely cost reimbursement of those funds. While this is not a statutory penalty, it is certainly a punishment to contractors doing business on a CAS covered basis with the Government.

Question 3(b). To what extent, if any, should the Board revise CAS 412 and 413 to harmonize with the contribution range defined by the minimum required contribution and the tax-deductible maximum contribution?

As we stated in our answer to question 3, we believe the Board should focus on the relationship of the PPA minimum required contribution and the contract costs in accordance with CAS 412 and 413 during their harmonization effort. Section 106 of the PPA states very clearly that the Board is to revise CAS 412 and 413 "to harmonize the minimum required contribution under the Employee Retirement Income Security Act of 1974 and the government reimbursable pension plan costs..." However, we do recommend that the Board consider retaining the concepts of assignable cost credit and assignable cost deficit that are likely to address the Board's concerns implied by this question.

Question 3(c). To what extent, if any, should ERISA credit balances (carryover and prefunding balances) be considered in revising CAS 412 and 413?

ERISA credit balances are the funded amounts in excess of the minimum funding required by ERISA. Contractors may choose to contribute more funds in the current year to reduce funding requirements in subsequent years. The analogous concept in CAS is prepayment credits, which are the funds in the pension plan in excess of cumulative pension costs. However, an important difference between CAS prepayment credits and their ERISA credit balance kin is that the CAS prepayment credits can have no affect on the amount of pension cost calculated in future years, which is desirable to achieve uniformity and consistency in CAS pension cost calculations.

Moreover, the ability of a contractor to influence pension costs charged to Government contracts simply by creating an ERISA prefunding balance in a pension plan is contrary to the Board's purpose of designing standards for uniformity and consistency, so we don't recommend the Board consider harmonizing the concepts of CAS prepayment credits and ERISA credit balances.

Question 3(d). To what extent, if any, should revisions to CAS be based on the measurement and assignment methods of the PPA?

We believe that for purposes of meeting the harmonization requirement in PPA, CAS 412 and 413 should essentially be based on the minimum required contribution calculations.

Question 3(d)(i). To what extent, if any, should the Board revise the CAS based on rules established to implement tax policy?

Though the Internal Revenue Code is referenced in the PPA, Section 106 of the PPA specifically requires harmonization of CAS 412 and 413 with the minimum required contribution under PPA not tax policy. We believe the Board should limit its revisions for CAS based on tax policy to considering retention of the assignable cost deficit provision in the existing CAS.

Question 3(d)(ii). To what extent, if any, should the Board consider concerns with the solvency of either the pension plan, or the PBGC?

We believe that the PPA addressed any solvency concerns related to pension plans and the PBGC.

Question 4(a). For Government contracting costing purposes, should the Board (i) Retain the current "going concern" basis for the measurement and assignment of the contract cost for the period, or (ii) revise CAS 412 and 413 to measure and assign the period cost on the liquidation or settlement cost basis of accounting?

We recommend that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA. We understand this requires a move away from the overly optimistic long-term view of current CAS, but we disagree that harmonization with PPA is synonymous with accepting a liquidation or settlement basis. In fact, the PPA methodology is somewhere between the current CAS and a liquidation (or settlement) approach.

The PPA methodology is a market-based measurement. Aspects of the calculation are consistent with treatment of costs on a going concern basis. For example, PPA requires a 7 year amortization period for any unfunded liability. Use of such an amortization feature is evidence that the calculation is not intended to establish a liquidation (or settlement) amount. The use of a market-based approach has been widely adopted across accounting disciplines (United States Financial Accounting Standards Board and International Accounting Standards Board among others) as the accepted measurement for pension costs. We believe a market-based approach for CAS is appropriate and is likely to be achieved through harmonization with PPA.

Question 4(b). For contract measurement, should the Board (i) Continue to utilize the current CAS requirements which incorporate the contractor's long-term best estimates of anticipated experience under the plan, or (ii) revise the CAS to include the PPA minimum required contribution criteria, which include interest rates based on current corporate bond yields, no recognition of future period salary growth, and use of a mortality table determined by the Secretary of the Treasury?

We recommend option (ii), using the PPA minimum required contribution assumptions. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

Question 4(c)(i)(1). For measuring the pension obligation, what basis for setting interest rate assumptions would best achieve uniformity and/or the

matching of costs to benefits earned over the working career of plan participants?

We recommend using the rate curve specified by the PPA. This would achieve consistency and uniformity between contractors greater than exists today under current CAS. It would also provide the best basis for matching costs to the benefits earned as the intent of PPA, as we understand it, is to secure the cumulative benefits earned by participants as of each accounting period; thus, the use of the rate curve under PPA measures pension costs from the perspective of the current accounting period's facts and data, rather than those assumed to occur over many years into the future. We believe the PPA approach is generally accepted to have better cost attribution to accounting periods as a result.

Question 4(c)(i)(2). To what extent, if any, should the interest rate assumption reflect the contractor's investment policy and the investment mix of the pension fund?

We recommend using the rate curve approach specified by the PPA. This would achieve consistency and uniformity among contractors and is in accordance with our recommendation of achieving harmonization by essentially basing the calculations for CAS on those of PPA.

Contractor's investment policies and investment mixes, given the generally accepted goal to minimize the risk to pension assets, are not likely to be significantly different. This investment strategy will certainly be reinforced by PPA to mitigate the volatility of potential funding requirements.

Question 4(c)(ii). For measuring the pension obligation, should the CAS exclude, permit, or require recognition of future period salary increases?

We recommend excluding future salary increases consistent with the PPA. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

We would not recommend permissive recognition of salary increases because this would undermine consistency among contractors.

Question 4(c)(iii). For measuring the pension obligation, should CAS exclude, permit, or require use of a (1) Standardized mortality table, (2) company-specific mortality table, or (3) mortality table that reflects planspecific or segment-specific experience?

We recommend using the same mortality table that the contractor uses for PPA. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

While PPA does allow companies to use a company-specific table, we believe their use is likely to gain little, if any, accuracy, and differences in companyspecific mortality tables between contractors are probably minimal.

Question 4(d). For contract cost measurement, should the Board (i) Retain the current amortization provisions allowing amortization over 10 to 30 years (15 years for experience gains and losses), (ii) expand the range to 7 to 30 years for all sources including experience gains and losses, (iii) adopt a fixed 7 year period consistent with the PPA minimum required contribution computation, or (iv) adopt some other amortization provision?

We recommend that option (iii), the fixed 7 year amortization period, should be the starting point for the Board during its harmonization efforts. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

Question 4(e)(i). For contract cost measurement, should the Board restrict the corridor of acceptable actuarial asset values to the range specified in the PPA (90% to 10%) of the market value?

We recommend that using the 90% to 110% corridor range specified in the PPA. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

Question 4(e)(ii). For contract measurement, should the Board adopt the PPA's two year averaging period for asset smoothing?

Based on our proposal, we believe that the two year averaging period for asset smoothing used by PPA should be the starting point for the Board during its harmonization efforts. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

Question 5. To what extent, if any, should the Board revise the CAS to include special funding rules for "at risk" plans?

Plan funding requirements have been established by ERISA, so we do not believe the Board needs to include any revisions for funding rules of "at risk" plans.

Question 6(a). To what extent, if any, should the measurement and assignment provisions of CAS 412 and 413 be revised to address contractor cash flow issues?

We believe that Section 106 of the PPA is evidence that Congress understands the seriousness of the potential cash flow challenges imposed by the PPA on Government contractors and intends the CASB to address theses issues by mandating harmonization of CAS 412 and 413 with PPA.

The potential cash flow concerns to Government contractors result from the inability of these companies to adjust their prices unilaterally to recover the additional cash outlays on a timely basis, as commercial enterprises have the option to do. Pension costs for Government contracts must comply with CAS, leaving contractors pinched between current CAS and PPA requirements. We also recognize that if a contractor's cash flow is impacted severely enough, the contractor may choose to terminate the pension plan, settle up all benefit obligations, and claim the resulting cost. This would certainly be contrary to securing such benefits for employees intended by Congress in passing the PPA, so it is logical that Congress would include the harmonization requirement to avoid such undesirable consequences.

We believe harmonization of CAS with PPA would provide fairness and equity to both the Government and contractors, as Congress intended, and meets with the CASB objectives.

Question 6(b). To what extent, if any, do the current prepayment provisions mitigate contractor cash flow concerns?

The prepayment provisions in current CAS do allow a contractor to ultimately recover their pension contributions made in excess of CAS assignable costs. However, this recovery may be so many years into the future as to be essentially nonexistent. Moreover, with the implementation of PPA funding requirements, the frequency and amount of contractors with prepayment credits is likely to increase significantly, so the delayed cost recovery will be far more of an issue than currently exists. While we believe the concept of prepayment credits should be retained in the revised CAS, there is no doubt that such a mechanism alone is woefully inadequate in meeting the objectives of Congress in harmonization.

Question 6(c). To what extent, if any, should the prepayment credit provision be revised to address the issue of potential negative cash flow?

We recognize that the objective of prepayment credits is to provide for equity between the Government and contractor. The Government is protected from a contractor funding their pension plan in excess of minimum requirements and immediately claiming those amounts, and the contractor is protected by having the opportunity to recover those excess contributions in future years. However, it is important to note that the protection provided to the contractor by the prepayment credit feature is only as real as the timeliness of the cost recovery.

We believe prepayment credits should be retained in CAS, but again, this mechanism alone would not satisfy the requirement of harmonization.

Question 7(a)(i). To what extent, if any, would adoption of some or all of the PPA provisions impact the volatility of cost projections?

Several provisions of PPA may expose cost projections to volatility if adopted for CAS.

The comparably shorter amortization period (7 years) for unfunded liabilities under PPA will reduce the smoothing effects of current CAS (10-30 years). This shortened amortization period would result in increased cost amounts over a shorter period of time.

The short (2 year) rolling average used as the bond interest rate for discounting the future pension liability will expose the liability calculation to market volatility. Current CAS generally uses a single steady discount rate over a long period of time. Because the liability balances involved are significant, even minor market fluctuations may translate into large dollar impacts.

The narrower corridor (90% to 110%), as compared with the current corridor (80% to 120%), allows for less tolerance of asset valuations outside the market acceptable measure requiring adjustment to market. This is likely to result in more frequent asset adjustments to market value. Furthermore, the short (2 year) amortization period for these mark-to-market adjustments provides little smoothing of this volatility by comparison with the current 15 year amortization period in CAS used for actuarial gains and losses.

Despite these exposures to volatility, we believe that adoption of the calculations used by PPA in the revised CAS is generally necessary to satisfy the harmonization requirement. We do recognize, however, that such volatility may be undesirable to the Government, and we believe the Board has options to address the Government's concerns. We encourage the Board to adopt the provisions as recommended of PPA and consider options to mitigate the volatility as necessary.

Question 7(a)(ii). Are there ways to mitigate this impact? Please explain.

We believe the Board has several options to address the volatility exposures from the adoption of PPA provisions for revised CAS to achieve harmonization.

One option for mitigating the volatility may be some sort of amortization feature that allows contractors to begin recovering costs immediately, but spreads the cost recovery evenly over an equitable period of time into the future. This concept is a similar approach to smoothing techniques in current CAS.

 $0 \leq f^{1/2}$

A second option for mitigating the volatility is establishing some sort of minimum and maximum cost recovery range. If cost calculations result in an amount outside the range, the difference would then be recognized in future years.

A third option, which is more unique to the immediate implementation of the harmonized CAS, is publication of transitional rules to smooth any abrupt spike in pension cost resulting from the revised CAS. We presume such rules would involve recognition of a short term spike in costs evenly over a stated period of years. We strongly urge the Board to consider transitional rules to protect both the Government and contractors.

Question 7(b). To what extent, if any, should the CAS assignable cost limitation be revised as part of the efforts to harmonize the CAS with the PPA?

We recommend the assignable cost limitation concept be retained in CAS with revisions to the asset and liability measurements to correspond with those in PPA. We believe this provision would still be effective for underfunded pension plans and is acceptable within the context of our recommendation to generally align the calculations of both PPA and CAS.

Question 7(c). To what extent, if any, should the CAS be revised to address negative pension costs in the context of cost volatility?

We recommend CAS not be revised to allow for negative pension costs. In order for pension costs for CAS to be claimed, those costs must be funded by assets in the trust which cannot be withdrawn. If negative pension costs were permitted for CAS, contractors would be funding pensions costs twice, once through required contributions into the pension trust and then again to the Government.

Question 8(a). To what extent, if any, would adoption of some or all of the PPA provisions affect measurement of a segment closing adjustment in accordance with CAS 413.50(c)(12)?

We recommend that the PPA funding target calculation should be the basis of measurement for the segment closing adjustment calculation in the revised CAS. This would again generally align the calculations of both PPA and CAS.

We also recommend that the Board retain the CAS concepts for the settling up of any underfunding (unfunded liability) or overfunding (less prepayment credits) related to previously claimed CAS pension costs, the provisions for segment closings due to transfers of ownership, and the provisions for plan terminations in which the liability is measured by the amount paid to irrevocably settle the benefit obligations. We believe these additional provisions address specific situations found in Government contracting that are beyond the scope of PPA and the requirement of harmonization.

Question 8(b). To what extent, if any, should the CAS 413 criteria for a curtailment of benefits be modified to address the PPA mandatory cessation of benefit accruals for an "at risk" plan?

The curtailment provisions in current CAS anticipate the permanent cessation of material benefit accruals for a pension plan. However, this is not an accurate description of "at risk" plans as defined by the PPA. In fact, after sufficient funding contributions are made; the benefit accruals not only resume, but catch up as if the cessation had not occurred. We believe that should the curtailment provision be retained in CAS during harmonization, PPA defined "at risk" plans should be excluded as curtailments.

Question 9(a). Should prepayment credits be adjusted based on the CAS valuation rate or the PPA requirement to use the pension fund's actual "return on assets" for the period?

We recommend that the actual return on assets be used for prepayment credits. While credit balances for PPA are not the same as prepayment credits for CAS, they are both part of the total assets which collectively for PPA will be adjusted for actual return on assets. Thus, we believe total assets for CAS, including prepayment credits, should be adjusted for actual return on assets in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

Question 9(b). Should the interest adjustment for contributions made after the end of the plan year be computed as if the deposit was made on the last day of the plan year or on the actual deposit as now required by the PPA?

We recommend that interest adjustments for contributions be based on the actual deposit dates as required by PPA. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

Question 9(c)(i). To what extent, if any, should CAS be revised to address the PPA provision that allows the recognition of established patterns of collectively bargained benefits?

We recommend using the same criteria as those used by PPA. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

Question 9(c)(ii). Are there criteria that should be considered in determining what constitutes an established patter of such changes?

We recommend using the same criteria as those used by PPA. This is in accordance with our recommendation that the Board achieve harmonization by essentially basing the calculations for CAS on those of PPA.

Question 10. The Board would be very interested in obtaining the results of any studies or surveys that examine the pension cost determined in accordance with the CAS and the PPA minimum required contributions and maximum tax-deductible contribution.

We appreciate that the Board understands the importance of reviewing data to evaluate the impacts of PPA and revisions to CAS. The impacts are likely to be different depending upon the circumstances of individual contractors, so we are hopeful that a number of information sources will be identified representing the diverse circumstances that exist across industry. Circumstances we encourage the Board to consider while reviewing data include different funding levels (over, under), existing assignable cost deficits, existing prepayment credits, and those with "at risk" plans. At this early point in the process, general studies such as those from actuarial consulting firms may be of most use to the Board. As the Board establishes the direction it intends to take, data modeling results will be a valuable tool industry can provide.

Question 11. In light of the changes to the PPA, should the Board consider including specific requirements in CAS 412 and 413 regarding the records to support the contractor's proposed and/or claimed pension cost?

FAR already includes requirements for supporting documentation for costs proposed and/or claimed, so no change in CAS is necessary.

Thank you for this chance to support the Board in this important undertaking. We look forward to additional opportunities in the future.

August 9, 2007

Cost Accounting Standards Board, ATTN: Laura Auletta Office of Federal Procurement Policy 725 17th Street, NW Room 9013 Washington, DC 20503

Re: CAS-2007-02S

This letter represents our response to the Staff Discussion Paper issued on July 3, 2007 by the Cost Accounting Standards Board pertaining to the harmonization of CAS 412 and 413 with the Pension Protection Act of 2006.

Background and Fundamental Principles

All of the Cost Accounting Standards reflect the intent to maintain:

- (1) equity between the government and its contractors,
- (2) uniformity among the contractors in how reimbursable expenses are developed and when they are charged to the government, and
- (3) a timely match between when the charges attributable to a contract are incurred and when they become recoverable.

When the two standards that address pension costs, CAS 412 and 413, were first developed in the 1970s and then later revised in 1995, the authors did their best to reflect the intent described above. However, over the last twenty years, the financial community, including regulators, investors and accountants, have come to view pensions very differently than they had in the 1970s, when ERISA and CAS 412 and 413 were first promulgated. In particular, most regulators and legislators, both in the United States and abroad, have come to view pension obligations and assets as market-driven entities that are preferably measured on an immediate, marked-to-market basis. This view differs greatly from the view held 30 years ago, when the long-term nature of the obligation made a "smoothed" view of assets and obligations appear preferable.

This change in view is attributable, at least in part, to the relatively recent history of pension defaults, which demonstrated that a smoothed approach works only if the plan sponsor remains viable during the most severe downturns. Other factors that may have contributed to the prevailing market-based view include the fact that the pension assets and liabilities have grown significantly over the decades, both in absolute dollars and as a proportion of the sponsoring companies' underlying business base, and a general shift toward market-based assessments of many types of intangible, non-fungible assets and liabilities.

One result of this change in approach is the passage of the Pension Protection Act (PPA) and its requirement that CAS 412 and 413 be "harmonized" with the "minimum required contributions" determined in accordance with PPA. This requirement implies that the actuarial approach used to determine pension costs under government contracts will become less smoothed and more market-based, which will almost inevitably result in a more volatile pattern of pension expense.

Even if the expense does become more volatile, the fundamental principles still apply. Equity still needs to be preserved: if the government reimburses a contractor for a pension cost, there should never be an opportunity to charge the government again for that cost. Conversely, if the contractor incurs a pension cost and meets the criteria for reimbursement, then the cost should be reimbursed. And if the contractor contributes to a pension plan an amount in excess of the reimbursable cost, then the excess amount remains attributable to the contractor as a prepayment credit until such time as the contractor is reimbursed in future years.

The "harmonization" requirement needs to be addressed within the context of the changed attitudes regarding pension liabilities and the resulting expense while still maintaining the integrity of the three CAS principles cited above.

Harmonization of CAS 412 and 413 with PPA

As noted in the Staff Discussion Paper, "Section 106 of the PPA instructs the Board to harmonize the CAS with the minimum required contribution ..." Before addressing the specific questions posed in the Staff Discussion Paper, it is useful to first comment upon the overall goal of "harmonization."

We begin by reviewing the meaning of the term "harmonization." Merriam-Webster's Online Dictionary defines "harmonize" as "to bring into consonance or accord." Black's Law Dictionary, Eighth Edition, offers the following definition:

harmony. Agreement or accord; conformity <the decision in *Jones* is in harmony with earlier Supreme Court precedent>. – **harmonize**, *vb*.

Based on the preceding, we view the goal of "harmonization" to be this: pension cost under CAS 412 should generally "conform" to the definition and calculation of the PPA minimum required contribution. Given the inherent differences between government

contract accounting and minimum funding, however, some differences are inevitable, as discussed below. Nonetheless, our comments are generally predicated on the notion that CAS 412 and 413 should be modified to bring the two Standards as close to PPA as is feasible.

With that background, we now address each of the questions posed in the Staff Discussion Paper. Our responses follow a common theme and hence are interdependent; as such, the responses to individual questions should not be considered in isolation.

Question 1. Should the Board apply any revisions to all cost-based contracts and other Federal awards that are subject to full CAS coverage, or only to "eligible government contractors" as defined in Section 106?

The Board should apply any revisions to all contractors for the following reasons:

- a. Conceptually, it would make no sense to have two different sets of pension accounting rules apply to contractors based on size. Such a program would be confusing to contractors and government personnel alike.
- b. Two sets of rules could lead to unintentional negative consequences for the contracting parties. For example, consider a competition between a small and large contractor competing for the same contract; if each was subject to different versions of CAS 412 and 413, the resulting differences in pension costs could skew the result of the competition.
- c. One set of pension rules would better meet the Board's stated goal of achieving uniform accounting practices among contractors.
- d. Contractors who barely meet or barely miss the sales and/or business thresholds under Section 106 of PPA could move in and out of "eligible government contractor" status due to periodic swings in their government contracting business activities; in such cases it would be difficult or impossible to monitor compliance. Likewise, acquisitions or divestitures could result in changes in status as an "eligible government contractor" as the test is formulaic in nature.

Question 2. Does the current CAS 412 and 413 substantially meet the Congressional intent of the PPA to protect retirement security, to strengthen funding and ensure PBGC solvency?

At the outset, even a cursory review of the fundamental differences between the current CAS and new PPA rules reveals that important and fundamental differences are present between the two sets of rules. In addition, we believe that Congress has expressed its intent to "protect retirement security, to strengthen funding and ensure PBGC solvency" through the provisions of PPA generally; Section 106 of PPA appears unrelated to these matters. Rather, the purpose of Section 106 seems quite clear – it is to provide equity

to government contractors by ensuring they are not required to make cash contributions that far exceed the amounts of pension costs that can be allocated to their government contracts.

That said, we infer that the real question being posed here is this: are the current CAS 412 and 413 already "harmonized" with PPA so that revisions to the Standards are not needed? If that is indeed the question, the answer is "no," they are not currently in harmony. We note that the statue explicitly states Congress' intent that revisions to CAS 412 and 413 are indeed required to effect "harmonization." As the Staff Discussion Paper notes:

In Section 106, Congress instructs the Board to:

" * * * review and revise sections 412 and 413 of the Cost Accounting Standards * * * to harmonize the minimum required contribution * * * of eligible government contractor plans and government reimbursable pension plan costs not later than January 1, 2010." [emphasis added]

If Congress believed there was a chance that the present CAS were in harmony with PPA, it presumably would not have directed the Board to make revisions, but rather would have instructed the Board to determine if any revisions were necessary.

Question 3. Should CAS harmonization be focused only on the relationship of the PPA minimum required contribution and the contract cost determined in accordance with CAS 412 and 413?

CAS harmonization should be focused on determining the annual cost under CAS 412 and 413 in a manner that meets both the letter and the spirit of Section 106 of PPA. The Board that promulgated the original version of CAS 412 in 1975 drew heavily on the minimum funding provisions of ERISA, thereby ensuring that contractors could generally recover the full amount of their pension contributions. That same principle – where contractors that fund their pension plans at the minimum required contribution level should neither gain nor lose from a cash flow perspective – should result from a harmonized version of CAS 412 and 413.

(a) Do the measurement and assignment provisions of the current CAS 412 and 413 result in a contractor incurring a penalty under ERISA in order to receive full reimbursement of CAS computed pension costs under Government contracts?

We are not clear exactly what the Board is asking in this question. Certainly, the current version of CAS 412 and 413 can result in substantial cash flow problems for contractors, because minimum funding requirements frequently exceed pension costs determined under CAS 412 and 413, and this condition would be exacerbated under PPA in the absence of CAS harmonization. Whether this would be considered a "penalty under ERISA" is not clear, however. Current CAS 412 and 413 do not require funding in excess of maximum deductible limits, thereby protecting contractors against

the imposition of excise taxes. We believe that similar provisions should be incorporated into the harmonized CAS 412 and 413.

(b) To what extent, if any, should the Board revise CAS 412 and 413 to harmonize with the contribution range defined by the minimum required contribution and the tax-deductible maximum contribution?

We first note that Section 106 of PPA mandates CAS Board harmonization with only the minimum contribution; accordingly, a focus on the maximum deductible amount seems unwarranted. From a practical perspective, if the Board concurs with the recommendations presented in this letter, we believe that it would be unnecessary to include a range other than that included in the present CAS 412 and 413 (i.e., that CAS pension costs can neither be less than zero nor more than the sum of the maximum deductible amount and prepayment credits). Assuming the Board retains the current requirement that CAS pension costs be funded, however, we recommend that the range cited in the prior sentence and the current "assignable cost credit" and "assignable cost deficit" methodology be retained.

(c) To what extent, if any, should ERISA credit balances (carryover and prefunding balances) be considered in revising CAS 412 and 413?

In our view, ERISA credit balances, which represent cumulative funding in excess of ERISA minimum contributions, represent an aspect of PPA that should not be harmonized with CAS 412 and 413. Instead, CAS prepayment credits should be treated under CAS 412 and 413 in a manner similar in some ways to the treatment ERISA credit balances receive under PPA. For example, the present CAS 412 and 413 rule that requires prepayment credits to be applied to reduce assets, which is similar to the treatment required under ERISA, should be retained. To be clear, if the total assets for a plan were \$1,000, and CAS prepayment credits were \$100, the asset value used for CAS purposes would be \$900.

At the same time, however, there are fundamental differences between ERISA credit balances and CAS prepayment credits. When ERISA was enacted, Congress intended pension plans to become adequately funded over a period of several years, and was less focused on the year-to-year variability in funded status. Accordingly, Congress provided plan sponsors with funding flexibility – by funding more than the minimum amount in one year, a credit balance would be created that would permit the sponsors to pay less than the minimum in another year.

The type of flexibility that was originally provided for ERISA minimum funding purposes – where contractors could exercise discretion over the amount of their contributions for a year – would be inappropriate for government contracting purposes (that is because this type of control would contradict the CAS Board's goal of "consistency" in cost accounting practices). In addition, prepayment credits represent amounts that a government contractor has contributed to a plan but has not yet allocated to government contracts as a pension cost.

For these reasons, prepayment credits should remain available to fund CAS pension costs but should not comprise an element of those costs. Stated differently, CAS pension costs should equal the sum of (1) normal costs (such as the "target normal cost" under PPA), plus (2) amortization payments (such as the "shortfall amortization charge" under PPA), plus (3) appropriate interest adjustments; prepayment credits should <u>not</u> be applied to reduce the amount of the measured and assigned CAS cost.

(d) To what extent, if any, should revisions to CAS be based on the measurement and assignment methods of the PPA?

To meet Congress' goal of harmonization, as well as to minimize ongoing actuarial fees and the potential for disputes, we believe that the revised CAS should utilize the actuarial "building blocks" of PPA. For example, the PPA "funding target" should replace the current "actuarial accrued liability" and the "target normal cost" should be used in lieu of the present "normal cost."

(i) To what extent, if any, should the Board revise the CAS based on rules established to implement tax policy?

As was the case with our response to question 3(a) above, it is not clear to us exactly what this question means. Because it is our understanding that the Board is revising CAS 412 and 413 solely to meet the "harmonization" requirements of Section 106 of PPA, it does not seem necessary for the Board to consider such a broad question at this juncture.

(ii) To what extent, if any, should the Board consider concerns with the solvency of either the pension plan, or the PBGC?

As was the case in the immediately preceding point, the question posed appears to be beyond the mandate of the Board. The requirements of PPA generally represent Congressional intent with respect to the solvency of pension plans as well as the PBGC. In our view, the Board need only be concerned with the requirements of Section 106 of PPA, which focuses on restoring balance between the PPA minimum contribution and pension costs under CAS 412 and 413.

Question 4. (a) Accounting Basis. For Government contract costing purposes, should the Board (i) Retain the current "going concern" basis for the measurement and assignment of the contract cost for the period, or (ii) revise CAS 412 and 413 to measure and assign the period cost on the liquidation or settlement cost basis of accounting?

Before addressing this question, we first note that the Board seems to mischaracterize PPA. Specifically, the PPA approach to ongoing minimum funding is not a "liquidation or settlement" approach. Although PPA contains many requirements that differ from the historical approach to "going concern" accounting (as embodied in the present CAS 412 and 413), and although some aspects of minimum funding calculations under PPA bear similarities to liquidation/settlement methodology, PPA nonetheless contains many attributes of ongoing accounting.¹ We further note that the question as posed would suggest that the continuing evolution in "going concern" financial accounting would constitute a "liquidation or settlement" basis which, as a matter of logic, cannot be the case.²

With that background, PPA has redefined the meaning of "going concern" minimum funding requirements under ERISA. In our view, it would be absurd for the Board to be the only regulatory body requiring the use of "old" actuarial methodology. For example, actuarial software would be required to produce liabilities under methods that would apply for CAS purposes only; system maintenance and training for the relatively small base of contractors sponsoring defined benefit plans would be expensive and the chance for errors would be high. Audits would become more contentious, as government experts would share many of the same challenges that would face contractors' actuaries. Disputes would be inevitable because accepted industry norms (based on surveys conducted by actuarial firms) of "old style" actuarial assumptions would no longer exist, and the actuarial assumptions in question would be made for CAS purposes only. The resulting cost and frustration could well encourage contractors to exit the defined benefit system.

In summary, it is our view that the Board should adopt the new "going concern" paradigm defined by PPA in developing revisions to CAS 412 and 413. For better or for worse, the world (i.e., Congress, the FAS Board and international accounting bodies) has adopted a new concept of determining pension costs for a "going concern"; it would be ill-advised for the CAS Board to decline to do likewise.

For example, PPA requires amortization of plan amendments, gains and losses, etc.; under settlement accounting, all such factors are recognized immediately. Similarly, PPA permits asset smoothing; for settlement purposes, market values must be used.

We recognize that many defined benefit practitioners believe that the recent changes in minimum funding and financial accounting requirements are ill-advised. Any such concerns, however, are irrelevant to the task at hand because the new approaches to minimum funding and financial accounting represent fundamental "givens" in today's business world.

(b) Actuarial Assumptions. For contract cost measurement, should the Board (i) Continue to utilize the current CAS requirements which incorporate the contractor's long-term best estimates of anticipated experience under the plan, or (ii) revise the CAS to include the PPA minimum required contribution criteria, which include interest rates based on current corporate bond yields, no recognition of future period salary growth, and use of a mortality table determined by the Secretary of the Treasury?

The Board, in adopting the PPA "building blocks" as described above, should simultaneously embrace the PPA actuarial assumptions. Specifically, the assumptions used by a contractor for ERISA purposes should be mandatory for CAS purposes. We note that this approach will ensure a far greater degree of uniformity than has existed under either of the prior versions of CAS 412 and 413.

- (c) Specific Assumptions. Please comment on the following specific assumptions:
- (i) Interest Rate: (1) For measuring the pension obligation, what basis for setting interest rate assumptions would best achieve uniformity and/or the matching of costs to benefits earned over the working career of plan participants?

As stated in our response to question 4(b), the PPA interest rates should also be used for CAS purposes.

(2) To what extent, if any, should the interest rate assumption reflect the contractor's investment policy and the investment mix of the pension fund?

Consistent with our response to question 4(b), the interest rate assumption would be set in accordance with PPA and there would be no need to consider the present investment policy and/or mix.

(ii) Salary Increases: For measuring the pension obligation, should the CAS exclude, permit or require recognition of future period salary increases?

As stated in our response to question 4(b), the PPA assumptions should also be used for CAS purposes. Consistent with the PPA, salary increases would not be permitted other than the one-year projection required for the PPA "target normal cost" as well as the determination of the maximum deductible contribution under PPA which, as discussed in our response to question 3(b), should continue to be utilized in determining the maximum amount of assignable CAS cost.

(iii) Mortality: For measuring the pension obligation, should the CAS exclude, permit, or require use of a (1) Standardized mortality table, (2) company-specific mortality table, or (3) mortality table that reflects plan-specific or segment-specific experience?

As stated in our response to question 4(b), the mortality table adopted for PPA purposes would also be used for CAS purposes. Thus, CAS 412 and 413 would not be required to deal with mortality assumptions, but rather would incorporate the minor degree of flexibility provided for by PPA.

(d) Period Assignment (Amortization). For contract cost measurement, should the Board (i) Retain the current amortization provisions allowing amortization over 10 to 30 years (15 years for experience gains and losses), (ii) expand the range to 7 to 30 years for all sources including experience gains and losses, (iii) adopt a fixed 7 year period consistent with the PPA minimum required contribution computation, or (iv) adopt some other amortization provision?

It is difficult to understand how Congress direction to "harmonize" CAS 412 and 413 with PPA would be served by utilizing any amortization period other than the 7 year period contained in PPA; for this reason, we recommend that 7 year amortization be extended to CAS purposes. By eliminating discretion, this approach would also help the Board attain increased uniformity. (In addition, please note the additional amortization/smoothing proposal discussed in our response to question 7(a)(i) below).

- (e) Asset Valuation. (i) For contract cost measurement, should the Board restrict the corridor of acceptable actuarial asset values to the range specified in the PPA (90% to 110% of the market value)?
- Yes. Consistent with the principles described above, we recommend that the total actuarial asset value for a plan (prior to adjustment for credit balances and prepayments) be identical for CAS and PPA purposes.
- (ii) For contract cost measurement, should the Board adopt the PPA's two year averaging period for asset smoothing?

Yes. As stated in our response to question 5(e)(i), we recommend that the total actuarial asset value for a plan (prior to adjustment for credit balances and prepayments) be the same for CAS and PPA purposes.

Question 5. To what extent, if any, should the Board revise the CAS to include special funding rules for "at risk" plans?

In directing harmonization of CAS with PPA minimum funding requirements, Congress made no distinction between plans that are "at risk" versus those that are not. Accordingly, under the "building block" approach, no special requirements would be required for "at risk" plans under CAS (also see our comments on curtailments in our response to question 8(b)). As would be the case generally under our proposal, the "building blocks" used under PPA would also be used for CAS purposes, regardless of whether the plan is "at risk" or not.

Question 6. (a) To what extent, if any, should the measurement and assignment provisions of CAS 412 and 413 be revised to address contractor cash flow issues?

It is our understanding that the purpose of Section 106 of PPA was to provide cash flow relief to government contractors. Specifically, the goal of harmonization is to minimize the extent of negative cash flow that contractors would suffer due to PPA minimum funding requirements exceeding assignable costs under the current CAS 412 and 413.

Under our proposal, no special provisions would be required in CAS 412 and 413 to deal with contractor cash flow issues; instead, the recommended symmetry between PPA and CAS, coupled with the predictability provisions in our response to question 7(a)(i), should sufficiently resolve contractor cash flow concerns in a reasonable and equitable manner.

(b) To what extent, if any, do the current prepayment provisions mitigate contractor cash flow concerns?

In concept, the current prepayment provisions mitigate cash flow concerns in that cash flow shortfalls are presumably temporary rather than permanent. The problem with the current rules, however, is that "temporary" could mean many years or even decades. For many contractors, such a definition of "temporary" is barely distinguishable from "permanent."

(c) To what extent, if any, should the prepayment credit provision be revised to address the issue of potential negative cash flow?

Conceptually, no revisions to the current prepayment provisions would be needed under our proposal (notwithstanding, a technical point concerning interest on prepayment credits is discussed below in our response to question 9(a)).

Question 7. (a)(i) To what extent, if any, would adoption of some or all of the PPA provisions impact the volatility of cost projections? (ii) Are there ways to mitigate this impact? Please explain.

At the outset, it is important for the Board to distinguish between <u>volatility</u> and <u>predictability</u>, and to identify the precise problems that can result. Due to the marked-to-market nature of PPA, with the attendant reduction in smoothing versus the traditional ERISA or CAS rules, it is likely that more volatility will exist in the resulting calculations. However, as explained below, it is our experience that the primary problem in practice over the last few decades has concerned predictability and the consequent impact on negotiated fixed price contracts. Given the nature of PPA, and assuming that funding of pension costs will continue to be required under CAS, we believe that it will be difficult to address this issue through traditional means of smoothing pension costs. However, a new CAS accounting concept – essentially a "pension cost stabilization account" – might yield a result that could satisfy the interests of both parties. The concept is most easily illustrated through a numerical example.

Suppose a contractor forecasts that its CAS pension costs will annually fluctuate between \$0 and \$100. Such a result is clearly volatile. However, further suppose that the contractor is able to accurately forecast its pension costs so that the amount of actual pension costs allocated to negotiated fixed price contracts is always equal to the amount that was forecast through the forward pricing process. Although volatile, this hypothetical contractor's pension cost would be predictable. As such, the amount of pension costs actually allocated to all negotiated government contracts would be in line with expectations, and neither contracting party would gain any advantage due to the volatility. In practice, however, it is the unexpected differences between actual and forecasted pension costs that yield what either party might view to be a windfall or shortfall on fixed price contracts.

To address this, we propose a two-pronged approach to pension costs. The first would, consistent with historical practice, govern the measurement, assignment and allocation of pension costs. We acknowledge that our proposal to utilize PPA "building blocks" for the revised CAS 412 and 413 would likely result in pension costs that are more difficult to predict. Accordingly, the second aspect of our proposal – the "pension cost stabilization account" mentioned above – is designed solely to address the predictability problem. In general, we recommend that CAS 412 and 413 permit the parties to identify the difference between actual and forecasted pension costs for a year, and to amortize the portion of that difference associated with negotiated fixed price contracts over some reasonable period.

Again, an example helps to illustrate the concept. Suppose pension cost for a year is forecasted to be \$100 but, due to favorable investment performance, is actually only \$80. Consistent with long-established principles, the \$80 in cost would be assigned to the period and, if funded, would be allocated to cost objectives. In addition, assume 50% of the \$80 pension cost (i.e., \$40) is allocated to negotiated fixed price contracts. Although it is impossible to determine the amount of pension costs actually embedded

in the price of a fixed price contract, assume that 50% of the \$100 forecast (i.e., \$50) was included in the fixed prices. Under this admittedly simplified view of fixed price contracts, the contractor would have recovered \$10 more than expected (i.e., expected costs of \$50 minus actual costs of \$40). Because this differential does not represent an element of CAS pension cost, and has not been contributed to the pension fund, it would be available to be returned to the government through reductions in the price of future negotiated fixed price contracts as explained below. Note that our proposal applies equally if costs were higher than expected (i.e., if pension costs were actually \$120 versus the \$100 forecast, the contractor would be entitled to increased recovery of 50% of the \$20 difference, or \$10, again through future negotiated fixed price contracts as explained below).

Once the impact of unpredictable differences between actual and forecasted costs has been identified for fixed price contracts, we propose that the differences (which would be accumulated in a "pension cost stabilization account") be amortized over a suitable period of years. For example, the \$10 differential described in the preceding paragraph might be returned to the government (or recovered by the contractor, depending upon whether forecasted pension costs were too high or too low) through annual pension forecast credits equating to a \$2 impact on the prices of negotiated fixed price contracts for each of the next 5 years. By amortizing these charges and credits over a period of years, the net amount of charge or credit will tend to be smooth, and favorable and unfavorable experience will tend to offset, thereby enhancing predictability of overall pension costs. This same type of approach could also be used to address the disposition of a business unit or other segment closing that might require an equitable distribution of any unliquidated "pension cost stabilization account" balances then remaining.

We recognize that this concept requires further investigation and modeling. We also note that the revised CAS 412 and 413 may require additional direction to enhance uniformity and consistency in pension cost forward pricing practices. Notwithstanding, this approach has the twin advantages of (1) permitting the Board to adopt a simplified version of CAS 412 and 413 that, by relying on the PPA "building blocks," would be equitable as well as easy to administer and audit and (2) introducing a fair and auditable approach to correcting for the unexpected fluctuations in pension costs.

In addition to the predictability issue, at the time any revisions to the CAS become effective, there will obviously be some differences between cost that had been previously forecasted under the current CAS and the revised cost that reflects any changes to the CAS. These differences will comprise another element of previously unpredicted cost variation. This would suggest that there should be a mechanism similar to the smoothing concept outlined above to deal with this transitional situation.

(b) To what extent, if any, should the CAS assignable cost limitation be revised as part of the efforts to harmonize the CAS with the PPA?

Other than utilizing the PPA "building blocks," the assignable cost limitation does not require modification.

(c) To what extent, if any, should the CAS be revised to address negative pension costs in the context of cost volatility?

Under our proposal, and consistent with current CAS 412, CAS pension costs would be required to be funded; as such, those costs should not be permitted to be below zero (because, once funded, the contractor would be unable to make a refund under present pension law). Note that the second aspect of our proposed methodology as described in our response to question 7(a) above (i.e., the charge or credit resulting from variances between actual and forecasted pension costs) could be negative (i.e., could result in a credit to the government).

Question 8. (a) To what extent, if any, would adoption of some or all of the PPA provisions affect the measurement of a segment closing adjustment in accordance with CAS 413.50(c)(12)?

As is the case with our proposal generally, we believe that the PPA "building blocks" would apply. Consistent with this approach, the PPA "funding target" would be used as the segment closing liability under CAS 413.50(c)(12). We further note that any other result would be inconsistent with a harmonized version of CAS. Specifically, assume a contractor's experience always tracked its actuarial assumptions; this would result in assets at the time of segment closing that would equal the PPA "funding target." In such a case, it seems clear that the segment closing adjustment should be zero, because everything worked out exactly as expected. In the absence of a plan termination (in which case the cost of annuities and lump sum payments should be used as the measure of liabilities), the use of any measure of liability other than the PPA "funding target" at the time of a segment closing would make no sense.

In addition, please note our comments at the end of our response to Question 7(a),

(b) To what extent, if any, should the CAS 413 criteria for a curtailment of benefits be modified to address the PPA mandatory cessation of benefit accruals for an "at risk" plan?

Because a "curtailment" under current CAS 413 represents neither the termination of the pension plan nor the termination of the contracting relationship, we recommend that the one-time settling up now required in connection with a curtailment be eliminated. In this manner, annual CAS pension costs would continue to be measured, assigned and allocated for curtailed plans. At a minimum, the PPA mandatory cessation of benefit accruals for "at risk" plans should be exempted from "curtailment" accounting.

Question 9. (a) Prepayment Credits. Should prepayment credits be adjusted based on the CAS valuation rate or the PPA requirement to use the pension fund's actual "return on plan assets" for the period?

Consistent with our general recommendations, we believe that the PPA "actual return" methodology should apply to prepayment credits subsequent to the effective date of the revised CAS. This approach will be less susceptible to error and would result in greater harmony between CAS and PPA.

(b) Contributions Made After End of Plan Year. Should the interest adjustment for contributions made after the end of the plan year be computed as if the deposit was made on the last day of the plan year or on the actual deposit as now required by the PPA?

Consistent with our general recommendations, we believe that interest adjustments on CAS pension costs should be computed based on the actual deposit dates. This approach will be less susceptible to error and will facilitate audits by ensuring symmetry between PPA and CAS amortization amounts. This will also resolve the present inconsistency between the views of CMS (which presumes that contributions made after the end of a plan year be treated as if made on the last day of the year) and DCAA (which determines the difference between actual funding dates and FAR scheduled dates, even if after the end of the year; see DCAA Contract Audit Manual 7.605.2d.(2)).

(c) Collectively Bargained Benefits. (i) To what extent, if any, should the CAS be revised to address the PPA provision that allows the recognition of established patterns of collectively bargained benefits?

We urge the Board to adopt the treatment accorded under PPA.

(ii) Are there criteria that should be considered in determining what constitutes an established pattern of such changes?

We urge the Board to adopt the treatment accorded under PPA.

Question 10. The Board would be very interested in obtaining the results of any studies or surveys that examine the pension cost determined in accordance with the CAS and the PPA minimum required contributions and maximum tax-deductible contribution.

We agree that this analysis should be an important aspect of developing revisions to CAS 412 and 413. To accomplish this goal, we recommend that the Board tentatively resolve the major issues affecting harmonization in its deliberations prior to publishing an advanced notice of proposed rulemaking. By narrowing the range of possibilities, it will be much easier for industry to model the consequences associated with proposed revisions and thereby provide the Board with actionable information. Although we understand the need for a rapid promulgation process in order to meet the effective

dates imposed by Section 106 of PPA, sufficient time will be needed to complete a robust modeling effort. For this reason, once the Board publishes its initial thoughts on harmonization, we recommend an extended comment period (i.e., at least 120 days) to allow industry sufficient time to digest the proposed approach, undertake modeling, analyze the results of the modeling, and provide suitable feedback to the Board.

Question 11. In light of the changes to the PPA, should the Board consider including specific requirements in CAS 412 and 413 regarding the records required to support the contractor's proposed and/or claimed pension cost?

We are not clear what information the Board is seeking here. In particular, we are not sure what additional recordkeeping requirements might be prompted by CAS harmonization.

We appreciate the opportunity to comment on the Staff Discussion Paper. Although we have listed our organizational affiliations and contact information, please note that we are making our response as individuals. As such, this response does not necessarily represent the views of our employers.
